Preface

Motivation for Reporting Task

4

Robust Research:

- “Robust research is about doing small things that stack the deck in your favor to prevent mistakes.”
—Vince Buffalo, author of Bioinformatics Data Skills (2015)

Reproducible Research:

- Reproducible research can be repeated by other researchers with the same results

Interactive Reporting:

- Apart from paper or PDF reports, allowing users to interact with the report allows them to ask questions about the data itself

Requirements for Reporting

5

Distributable:

- Self-contained report that makes it easier to get feedbacks

Viewable to Anyone:

- Viewable to non-engineers in order to eliminate information asymmetry e.g.) In most cases, JupyterLab can only be accessed by engineers

Automate Reporting:

- Reporting task should be done at the same time as analysis task
- Preliminary analytical design becomes more important

02

...

What's RMarkdown?

What's RMarkdown?

RMarkdown is a widely-used tool for creating automated, reproducible, and share-worthy outputs, such as reports (html, pdf, docx, ...)

R Markdown script

```
1 ---
2 title: "Outbreak Situation Report"
3 date: "4/24/2021"
4 output: word_document
5 ---
6
7 [[r setup, echo=FALSE]]
8 pacman::p_load(rstudio, here, tidyverse, janitor, incidence2, flextable)
9 linelist <- rio::import(here::here("data", "case_linelist", "linelist_cleaned.rds"))
10
11
12 This report is for the Incident Command team of the fictional outbreak of Ebola cases.
13 **As of `r format(max(linelist$date_hospitalisation, na.rm=T), "%d %B")` there have
14 been `r nrow(linelist)` cases reported as hospitalized.**
15
16 ## Summary table of cases by hospital
17
18 [[r, echo=F, out.height="75%"]]
19 linelist %>%
20   filter(!is.na(hospital)) %>%
21   group_by(hospital) %>%
22   summarise(cases = n(),
23             deaths = sum(outcome == "Death", na.rm=T),
24             recovered = sum(outcome == "Recover", na.rm=T)) %>%
25   adorn_totals() %>%
26   oflextable()
27
28
29 ## Epidemic curve by age
30
31 [[r, echo=F, warning=F, message=F, out.height = "75%", out.width="100%"]]
32 # create epi curve
33 age_outbreak <- incidence(
34   linelist,
35   date_index = date_onset, # date of onset for x-axis
36   interval = "week", # weekly aggregation of cases
37   groups = age_cat)
38
39 # plot
40 plot(age_outbreak, n_breaks = 3, fill = age_cat, col_pal = muted, title = "Epidemic
41 curve by age group")
42 ---

Outbreak Situation Report

4/24/2021

This report is for the Incident Command team of the fictional outbreak of Ebola cases. As of 30 April there have been 5888 cases reported as hospitalized.

Summary table of cases by hospital

hospital	cases	deaths	recovered
Central Hospital	454	193	165
Military Hospital	896	399	309
Missing	1,469	611	514
Other	985	395	290
Port Hospital	1,762	765	579
St. Mark's Maternity Hospital (SMH)	422	199	126
Total	5,888	2,562	1,963

Benefits of RMarkdown

Easy to Deliver:

- We can distribute html reports. Other formats (pdf, docx) are available
- Can be attached to ESA (up to 10MB by default)

Easy to Reproduce:

- Easy to recreate the report if the report data is updated
- We can easily create reports if know Markdown

Rich Expression:

- Interactive report (only html format)
- Ingenuities that can aggregate information, such as Tab / Table display

How to make reports with RMarkdown

RMarkdown Workflow: [\[Link\]](#)

11

- RMarkdown is an enhanced version of Markdown that lets you embed R code into the docs
- .Rmd \rightarrow .md \rightarrow Document(.html/.pdf/.docx)

Creation example by R

- Prepare 2 type of files for report contents(.Rmd) and rendering(.R)

Report contents(.Rmd)

```
# Let's embed some R code
```

```
```${r}
```

```
library(dplyr)
```

```
library(readr)
```

```
gm <- read_csv('data/gapminder.csv')
```

```
```\n
```

The mean life expectancy is

```
`r mean(gm$lifeExp)` years.
```

The years surveyed in this data include:

```
`r unique(gm$year)`.
```

Rendering(.R)

```
library(rmarkdown)
```

```
rmarkdown::render(  
  input=input_file_Rmd,  
  output_format="html_document",  
  output_file=output_file,  
  encoding='utf-8',  
  quiet=F)
```

Call R from Python

- We can easily call R from Python

```
import os
os.system("Rscript ./render.R --arg1=xxx --arg2=yyy, ...")
```

- We can also use R with Google Colaboratory, just adding below

```
[ ] # activate r magic
    %load_ext rpy2.ipython
```

```
[ ] %%R
    Sys.setenv(TZ="Asia/Tokyo")
    install.packages('argparse')
    install.packages('rmdformats')
    install.packages('formattable')
    install.packages('DT')
```

Standard error

Standard Deviation Statistical Classification

536 share edit

What is a Standard Error?

Standard error is the measurement of how dispersed a sample's means are from the population mean. In the vast majority of cases, standard error is defined as the [standard deviation](#) divided by the square root of the sample size.

One exception is in [regression analysis](#), where standard error can refer to both the square root of the reduced chi-squared statistic and the standard error for a regression coefficient, such as [confidence intervals](#).

A photograph of a wind farm on a grassy hill. Several white wind turbines are visible, with the largest one in the foreground on the left. The sky is bright blue with large, fluffy white clouds. In the foreground, there is a small, rustic building with a corrugated metal roof and a dirt path. The overall scene is bright and sunny.
